

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (currently amended) A computer implemented method for communicating data in a clustered computing system, the method comprising:
detecting an occurrence of an initial event at a first node of the system;
detecting an occurrence of one or more subsequent events at the first node of the system;
determining that the information about the initial event is identical to the information about said one or more subsequent events;
in response to determining that the information about the initial event is identical to the information about said one or more subsequent events, appending, onto an existing message, a notification that includes information that describes a single instance of an event selected from a set of events that consists of (a) said initial event; and (b) said one or more subsequent events;
propagating the notification to [[the]] a receiving node,
wherein the message is destined to be propagated to [[a]] the receiving node, wherein the receiving node [[that]] is not a node sending the message.
2. (original) The method of Claim 1, wherein the message was generated for purposes other than sending information appended.
3. (currently amended) The method of Claim 1, wherein the determining further comprises:
comparing information that describes the [[first]] initial event with information that describes the ~~second event~~ one or more

subsequent events to determine whether the initial event and the one or more subsequent events are identical; and the method further comprising if the events are identical, then indicating that the information that describes the subsequent events no longer needs to be retained.

4. (previously presented) The method of Claim 1, wherein the method further comprises:
setting an identifier indicating that the information describing an identical event is to be appended onto a message and propagated to a particular node.
5. (original) The method of Claim 1, wherein said clustered computing system comprises a database management system.
6. (original) The computing environment of Claim 1, wherein said clustered computing system comprises a shared-disk database system.
7. (original) The computing environment of Claim 1, wherein said clustered computing system comprises a shared-cache parallel database management system.
8. (original) The computing environment of Claim 1, wherein said clustered computing system comprises a shared-nothing database management system.
9. (original) The computing environment of Claim 1, wherein said clustered computing system comprises a distributed database management system.

10. (original) The method of Claim 1, wherein the method further comprises:
searching a shared-memory event buffer having a size that is fixed.
11. (original) The method of Claim 1, wherein the message has a fixed size, and the method further comprises:
appending additional information that describes additional events onto existing
message traffic until free space in the fixed-size message is filled.
12. (previously presented) The method of Claim 1, wherein the method further comprises
placing the information describing an identical event in a queue.
13. (original) The method of Claim 12, wherein the queue includes at least a priority
queuing mechanism in order to determine a priority for events such that high priority
events would supercede a low priority events in an event notification queue.
14. (original) The method of Claim 1, wherein an in-memory hash index is used to
determine if an event exists in a shared-memory event buffer.
15. (previously presented) The method of Claim 1, wherein the method further
comprises:
partitioning a shared-memory event buffer;
generating an event buffer entry of the shared memory event buffer;
placing an event identifier into the event buffer entry; and
inserting the information describing an identical event into the event buffer entry.
16. (currently amended) The method of Claim 15, the method further comprises if
between a fastest head pointer and a tail pointer there does not exists a buffer entry in
the shared memory event buffer for an identical event, generating a new event buffer

- entry, and the inserting further comprises inserting the information describing the said identical event into the new event buffer entry.
17. (currently amended) The method of Claim 15, wherein the inserting comprises:
if between a fastest head pointer and a tail pointer there exists a buffer entry in the shared memory event buffer for the identical event, updating the buffer entry so that the buffer entry represents the subsequent occurrence.
18. (currently amended) The method of Claim 15, further comprising
using a round robin method and the shared memory event buffer to determine to which existing message to appended the information describing an identical event.
19. (currently amended) The method of Claim 1, wherein the method further comprises the step of:
maintaining information that describes a plurality of events.
20. (previously presented) The method of Claim 19, wherein the method further comprises the step of :
maintaining information that describes the plurality of events in a shared-memory event buffer.
21. (previously presented) The method of Claim 19, wherein the method further comprises:
maintaining information that describes the plurality of events in a circular buffer.
22. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more

- processors, causes the one or more processors to perform the method recited in Claim 1.
23. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 2.
24. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 3.
25. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 4.
26. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 5.
27. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 6.

28. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 7.
29. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 8.
30. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 9.
31. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 10.
32. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 11.
33. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 12.

34. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 13.
35. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 14.
36. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 15.
37. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 16.
38. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 17.
39. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more

- processors, causes the one or more processors to perform the method recited in Claim 18.
40. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 19.
41. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 20.
42. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 21.
43. (previously presented) A computer implemented method for communicating data in a clustered computing system, the method comprising:
detecting an occurrence of an event at a first node of the system,
determining if the information about said event is identical to another
previously occurring event;
appending onto an existing message a notification that describes a single
instance of said event, wherein the message was destined to be
propagated to a receiving node that is not a node sending the
message; and
propagating the notification to the receiving node.

44. (original) The method of claim 43, wherein the determining further comprises:
if there exists a stored indication that an identical event was previously generated and the propagating of the message having the information appended did not yet occur, then an indication is stored that multiple identical events were generated.
45. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 43.
46. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 44.
47. (previously presented) A computer implemented method comprising the computer-implemented steps of:
receiving, at a database server that is executing on a second node in a distributed system, a message that (a) was transmitted by a first node in the distributed system and (b) subsequently had appended thereon information describing an event;
retrieving the information describing the event from the local node where said event occurred; and
invoking concurrency control techniques to control concurrent access to a shared-memory event buffer from processes that propagate messages to subscriber nodes and processes that generate events.

48. (cancelled)
49. (original) The method of Claim 47, wherein said method further comprises:
maintaining information that describes a plurality of events,
coalescing the information that describes a plurality of events, wherein the
information that describes a plurality of events may be coalesced for the same
event into a single event notification.
50. (original) The method of Claim 47, wherein the method further comprises:
maintaining the information that describes a plurality of events.
51. (previously presented) The method of Claim 47, wherein the method
further comprises step of:
maintaining information that describes the plurality of events in a
shared-memory event buffer.
52. (previously presented) The method of Claim 47, wherein the method
further comprises the step of:
maintaining information that describes the plurality of events in a
circular buffer.
53. (currently amended) A computer-readable storage medium carrying one
or more sequences of instructions, which when executed by one or more
processors, causes the one or more processors to perform the method
recited in Claim 47.

54. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 48.
55. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 49.
56. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 50.
57. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 51.
58. (currently amended) A computer-readable storage medium carrying one or more sequences of instructions, which when executed by one or more processors, causes the one or more processors to perform the method recited in Claim 52.
59. (original) A computer apparatus comprising:
a processor; and
a memory coupled to the processor, the memory containing one or more sequences of instructions for event notification in a clustered computing

environment, wherein execution of the one or more sequences of instructions by the processor causes the processor to perform the method of Claim 1.
